                                                                                                                                                                                                                                                                                                                                                             The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases.
                                                                                                                                                                                                                                                       New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer -

The present invention relates to a process for determining and monitoring the genetic variability of vegetable species comprising identifying genetic polymorphisms in plant tubulins via PCR. The present sequence is a PCR primer for rice beta-tubulin coding sequence (TubBi6 isotype). This primer is used in the process of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide; p38 mitogen activated protein kinase; MAPK, antirkhematic; antiarthritic; immunosuppressive; cardiant; heart disease; antiinflammatory; autoimmune disease; rheumatoid arthritis; apoptosis; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to antisense compounds 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein kinase (MAPK), where the antisense oligonucleotides inhibit the expression of MAPK. Sequences antisense oligonucleotides inhibit the expression of MAPK. Sequences CDNA sequences. AAC79501 represent human p38alpha MAPK and p38beta MAPK oDNA sequences. AAC79510 and AAC79502 - AAC79522 - AAC79521 and AAC79511 - AAC79580 represent human p38beta antisense oligonucleotides. Also included in the invention are a p38alpha contx sequence AAC79523 and antisense oligonucleotides AAC79533 - AAC79536 isolated from rat tissue. Murine p38beta MAPK cDNA is represented in AAC79537 and antisense oligonucleotides AAC79533 - AAC79538 - AAC79552.
    species, comprising identifying genetic polymorphisms in plant tubulins, useful for monitoring variability between cultivated and wild
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compound targeted to p38 mitogen activated protein kinas inhibits protein kinase and is useful for diagnosing and treating inflammatory, autoimmune and heart disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human p38beta antisense oligonucleotide SEQ ID 42.

                                                                                                                                                                                                                                                                                                            PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAZ05754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Attrisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye

            immunosuppressive; cardiant and antiinflammatory activity. The antisense oligonucleotides are useful for inhibiting the expression of p38 MAPK in cells or tissues. The oligonucleotides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthritis, or heart disease. The oligonucleotides are also useful for inhibiting inflammation or apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a PCR primer used to amplify a fragment of human mitochondrial DNA (mtDNA). The primer is used in the method of the invention for detecting an abnormality in human mtDNA, where the abnormality is related to familial nephrosis. The method involves detecting at least one mutation at one of four positions in human mtDNA: 2) 2246, adenine to guanine; 3) 14180, thymidine to cytosine, or 4) 14927, adenine to guanine.

The method is used in the genetic diagnosis of familial nephrosis.

The invention relates to the isolation of a nucleic acid (AAA11284) coding for a transmembrane protein TRPC7 (AAY92944) which is expressed in brain and is homologous to transient receptor potential (TRP) protein. This suggests that the TRPC7 protein may have a calcium channel function. The genomic sequence has been shown to contain 31 introns. This sequence represents an exon/intron junction from the genomic TRPC7 sequence. The DNA and protein can be used in the diagnosis and treatment of disorders associated with TRPC7, especially the screening, monitoring and treatment (Dr gene therapy) of periodic psychosis, which appears to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of chemopreventing cancers sensitive code 4. Accompófiavone by administration of a sufficient amount of a cancer 4. Accompófiavone by administration of a sufficient amount of a cancer 4. Accompórative composition comprising 4. Accompória that induce phase II enzymes in mammals that inhe metabolic detoxification of xenobiotic compounds in mammals. One such phase II enzyme is quinone reductase. This enzyme promotes obligatory 2 electron reductions of quinones thus preventing their participation in oxidative cycling and interactions with critical nucleotides. Primers AAAII139 were used to detect quinone reductase mRNA expression in cells before and after treatment by the method of the invention. Primers AAAII140-AII141 were used to detect the rat beta-actin gene as a control for the mRNA detection step. The methods are used to prevent tumour growth and to suppress the initiation of cancers including carcinomas.

The invention relates to a novel polypeptide self-antigen (I) useful as a tumour-specific vaccine in a subject with a tumour or at risk of developing a tumour. (I) includes an epitope or epitopes unique to, or over expressed by, cells of the tumour, thereby distinguishing the tumour from all other tumours of the same or different histological type, or in the subject or in another member of the subject's species. (I) is explose of inducing an immune response in a mammal, when used as an individual-specific immunogenic product comprising (I); and as a vaccine composition useful for inducing a tumour-specific immune response, idiotype-specific anti-lymphoma immune response to an least one idiotype of a tumour-specific immune response to an idiotype of a surface immunoglobulin or a polyclonal immune response to an idiotype of a surface immunoglobulin or a polyclonal immune response to an idiotype of a tumour e.g. B-cell lymphoma, and was treated so that no tumour is cantibody response in a tumour-bearing subject or a subject who had a tumour e.g. B-cell lymphoma, and was treated so that no tumour is clinically or radiographically evident. (I) is useful for inducing a protective antitumour immune response. (I) can be produced at high clevels, is easy to purify and can be appropriately folded to mimic the conformation of the native epitopes displayed at the tumour cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is human secreted Frizzled-related protein 2 (sFRP2) gene specific reverse transcription PCR (RT-PCR) primer. The invention relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Frizzled-related protein (sFRP) gene. It is also useful in antisense therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tumour; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selelower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound 8-30 nucleobases in length targetted to a nucleic acid molecule encoding human hepsin. The antisense compound specifically hybridises with and inhibits the expression of human hepsin. The antisense compound or the pharmaceutical composition is useful for treating animals and humans having a disease or condition associated with the expression of hepsin, e.g. inflammation or tumour prophylaxis (e.g. to prevent or delay infection, inflammation or tumour formation) or as research reagents and kits. The method is useful for modulating, specifically inhibiting the expression of hepsin which may be used in research, e.g to distinguish between functions of various members of a biological pathway. The invention is used in gene therapy. The

The invention relates to antisense compounds, compositions and methods antisense compounds, particularly antisense oligonucleotides, targetted to mucleic acids encoding hepsin. The antisense compound is useful for nucleic acids encoding hepsin. The antisense compound is useful for hibbiting the expression of hepsin in human cells or tissues. It is also useful for treating an animal having a disease or condition associated with hepsin, by inhibiting expression of hepsin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human hepsin DNA. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense compound targeted to nucleic acids encoding human hepsin, useful for inhibiting the expression of hepsin in human cells or tissues, and for treating humans having a disease associated with

The invention relates to a marker for testing analogues of vitamin D responsive cell, comprises at least one gene pertinent to the action of vitamin D-responsive cell, comprises at least one gene pertinent to the action of vitamin D for testing the analogues and determining analogues capable of regulating the gene, and is indicative of a chemopreventive or chemotherapeutic agent. The invention is useful for testing analogues of vitamin D expected to be effective in reducing aberrant activity of vitamin D-responsive cell of or for testing analogues of vitamin D suspected to have antiproliferative activity. The invention is useful for reducing aberrant activity of vitamin D-responsive cell, where the disorder is aselected from cancer, psoriamis, multiple cell, where the disorder is aselected from cancer, psoriamis, multiple cell, where the disorder is aselected from cancer, psoriamis, multiple collerosis, osteoporosis, osteodystrophy, osteomalacia and carget agenes correlated with the antiproliferative effect of vitamin D and its analogues. The invention is useful for identifying regulated and its analogues. The invention is useful for protecting against in vivo DNA damage, for inducing in vivo DNA tepaker mechanisms in a mammal, or the reducing or preventing DNA damage to the skin of a mammal, preferably thuman. The invention is useful for the single or human. The invention is useful for identifying regulated the reducing or preventing DNA damage to the skin of a mammal, preferably human. The invention is useful as a genoprotective or chemoprotective depart. The invention is useful as a marker for the activity of DNA repair mechanisms. The invention is useful for testing compounds susceptible of inhibiting an enzyme which metabolises 1,25-dinydroxyvitamin D3. The invention is useful for treating epidermal wounds. The present sequence multiple sclerosis; osteoporosis; osteomalacia; hyperparathyroidism; genoprotective; epidermal wound; chemoprotective; DNA repair mechanism; cytostatic; psoriasis; neuroprotective; vulnerary; RT-PCR; primer; ss. Novel mammalian nuclear receptor polypeptide, L66, useful for screening for agents which inhibit cellular function of the polypeptide and for construction of multiple nuclear receptor specific sequence alignments

Disclosure; Fig 18A; 136pp; English.

The present invention relates to mammalian nuclear receptor proteins, L66 (also referred as FXR-beta) and polynucleotides encoding such proteins. CC (also referred as FXR-beta) and polynucleotides encoding such proteins. CC dequences of the are useful for screening for agents which are capable of inhibiting the cellular function of L66. They are useful for the construction of protein sequence alignments. L66 proteins are useful for screening drugs for agonist and antagonist activity, for developing antibodies for depending antibodies for developing antibodies for developing antibodies for isolating compounds which affect the cell-free screening assays for isolating compounds which affect the activity of L66, for in silico, i.e., computer analyses, for identifying domains and new receptors and for modelling the 3-dimensional structure CC determining L66 expression levels, for transforming cells, as scientific research tools for developing nucleic acid probes and primers and for developing analytical tools for selectively inhibiting expression of the L66 gene to determine physiological responses. The present DNA sequence is an incompleted. an intron 4/exon 5 junction sequence of mouse L66 gene.

The invention relates to an isolated functional Type II GARH-R), or a peptide comprising at least a portion of exon I of Type II GARH-R), or a peptide acids encoding at least a portion of exon I of Type II GARH-R, nucleic acids encoding the receptor, an expression vector comprising the nucleic acid, a host cell transformed with the vector, a transgenic animal having the construct stably integrated into its genome, an antibody able to bind specifically to Type II GRH-R. The Type II GRH-R is useful in gene therapy. The Type II GRH-R is particularly useful for inhibiting endogenous Type II GRH-B binding to its native receptor in vivo or as a contraceptive. The receptor may also have roles in neural development and sexual arousal The present sequence is a PCR primer used to amplify a nucleic acid encoding human type II GRH-R from tissue samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to diagnosis of hepatitis B virus (HBV) infection stages comprising identification of full length HBV transcripts (I) and truncated HBV transcripts (II) in a serum sample, where the ratio of I:II is indicative of a particular infection stage. The method is useful for diagnosing HBV infection stages and determining the risk for developing hepatocellular carcinoma. The present sequence is that of a

complementary oligonucleotides hybridize with little mismatch

Appergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents Epstein-Barr virus and polio virus, and parasitic infectious agents as elected from Onchoverva volvulus, Entamoeba histolyfica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Co betecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from ERCA1 gene, involved in DNA amplification from an interpretation or repair, the cancer is specifically associated with a gene selected from ERCA1 gene, method is also used for environmental monitoring forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonoclectide probesets occurred and correlating (using a computer) identified ligation to a presence or absence of the target uncleotide sequences. ABI82074 to ferror entry in the exemplification of the correlation of the computer of the exemplification of the correlation of the computer of the exemplification of the correlation of the computer of the exemplification of the correlation of the correlation of the correlation of the correlation of the computer of the exemplification of the correlation of the exemplification of the correlation The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Example 5; Fig 29; 300pp; English

the present invention.

New antisense oligonucleotide targeted to a nucleic acid encoding short

eterodimer partner-1, useful for treating diseases involving abnormal pid or cholesterol metabolism, e.g atherosclerosis or cardiovascular heterodimer diseases

Claim 3; Page 94; 121pp; English.

partner-1. The movel compound specifically hypridizes with a nucleic acid molecule encoding the short heterodimer partner-1, and inhibits the expression of the nucleic acid molecule. The compound, and a composition comprising it are useful for treating a disease or condition associated with the short heterodimer partner-1, particularly a condition involving abnormal lipid or cholesterol metabolism such as atheroscalerosis or a cardiovascular disease. They are also useful in research and diagnostics for modulating the expression of short heterodimer partner-1. They can also be useful prophylactically in preventing or delaying infection, inflammation or tumour formation. This polynucleotide sequence represents a human antisense oligo relating to the heterodimer partner-1 of the The invention relates to a novel compound of 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding a short heterodimer partner-1. The novel compound specifically hybridizes with a nucleic acid invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mENAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction
                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                  nucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein kinase (MAPK). The products of the invention have antiarthritic and antiinflammatory activity, can act as as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                     This invention describes a novel antisense compound, which is 8-30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                    .

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTP8) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. lenkaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheiner's, particularly for treating Alzheiner's, oplymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab PCR primer for human SAD.
                                                                                                                                                                                                                                           type I receptor serine/threonine kinase; cancer; leukaemia; lymphoma; neurodegenerative disease; neuronal survival; Alzheimer's disease; Parkinson's disease; FCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

pck primers AAZ45242-43 were used to amplify cDNA encoding a human angiogenesis-associated protein which is able to bind an N-terminal tragment of plasminogen. The protein is designated ABP-1, and binds the first 4 kringle domains (k1-k4) and/or kringle 5 (K5) of plasminogen. These four kringle domains comprise angiostatin. The protein acts as a receptor for plasminogen. The angiostatin-binding contain of the ABP-1 protein is described in AAY54054. A polymorphic variant of ABP-1 is also described in AAY54053. ABP-1 can be used to manufacture medicaments for treating angiogenesis-related diseases or disorders, such as tumor conditions, diabetes, rheumatoid arthritis, and even some inflammatory diseases such as psoriasis, chronic inflammation of the intestine, asthma, etc.. The protein may also be consed in gene therapy techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with Alzheiner's disease. Inhibitors of beta-secretase are administered to as mammalian subject e.g. with Alzheimer's disease or Alzheimer's disease. Inhibitors of beta-secretase are administered to disease. Inke pathology to test if they maintain or improve cognitive ability or reduce the plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease. PCR primers AAA59530-49 were used to amplify DNA encoding beta-secretase
                                                                                                                                                                                                                                   Beta-secretase; beta-amyloid precursor protein; beta-amyloid peptide; amyloid plaque component; Alzheimer's disease; amyloidogenic disease; inhibitor; PCR primer; ss.

Parkinson's disease, epilepsy, cystic fibrosis, Paget's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of PCR primer 2351-48. The primer was used in a 3'RACE, using a human foetal scalp cDNA library as template, to obtain the 3' sequence of human interleukin-1 receptor antagonist-related protein (IL-1ra-R) cDNA. Full-length clones [see AAI70234-35] encoding human IL-1ra-R (see AAM50217-18), a protein that has interleukin-1 inhibitor activity, were subsequently obtained. The invention provides IL-1ra-R polypeptides and nucleic acids, as well as selective binding agents, vectors, also provides pharmaceutical compositions and methods for the diagnosis, treatment, amelial compositions and methods for the disagnosis, treatment, amelial compositions and methods for the disagnosis, treatment, amelial composition and/or prevention of diseases, including also conditions associated with IL-1ra-R, such as those formal conditions associated with IL-1ra-R, such as those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cestrum yellow leaf curling virus; CMYLCV; transcription; PCR primer;

The invention relates to Cestrum yellow leaf curling virus (CMYLCV) novel DNA sequences which functions as transcription promoters of an associated polynucleotide sequence. These CMYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which are used for creating transgenic plants expressing DNA of interest at all times and in most tissues and organs. The present DNA sequence is a PCR primer which is used for amplifying cestrum yellow leaf curling virus
                                                                                                                                                                                                                                                                                 Novel DNA sequence obtained from genome of Cestrum yellow leaf curling virus for conferring constitutive expression of an associated desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cestrum yellow leaf curling virus; CmYLCV; transcription; PCR primer;

Human dehydrogenase subunit protein isomer and its coding sequence Xu Z, RESULT 118 à g

```
The invention relates to Cestrum yellow leaf curling virus (CMYLCV) novel DNA sequences which functions as transcription promoters of an associated polynucleotide sequence. These CMYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which are used for creating transgenic plants expressing DNA of interest at all times and in most tissues and organs. The present DNA sequence is a PCR primer which is used for amplifying cestrum yellow leaf curling virus
                                                                                                 Novel DNA sequence obtained from genome of Cestrum yellow leaf curling virus for conferring constitutive expression of an associated desired

(SCHR-) SOUTH CHINA RES CENT CHINA HUMAN GENE GR.

Xiao H, Kang B;

WPI; 2001-245681/26.

The present invention relates to a new human NADH dehydrogenase subunit 4 (NDSH) isoform expressed in human body dendron-shaped cell and its coding sequence. The present invention also relates to a preparation method of said protein and nucleic acid sequence and a method of detecting polypeptide of human NDS4-iso nucleic acid sequence in sample. Example 1; Page 17; 20pp; Chinese.

The invention relates to an isolated nucleic acid molecule (a promoter of rice chemically induced cDNA (RCI-1), which encodes a lipoxygenase) capable of driving chemically inducible but not wound or pathogen-inducible expression of an associated nuclectide sequence. Also included are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the lipoxygenase gene, promoter fragments, the lipoxygenase transit ceptide which directs expressed proteins to the plastid, a vector comprising the promoter or fragments and a transgenic plant comprising the promoter or fragments are useful for expressing a nucleotide sequence of interest the transit peptide is useful for targeting an associated protein of interest to plastids. A nucleic acid which expresses polypeptide having lipoxygenase activity is useful for inhibiting fungal mycotoxins when transformed into a plant. The lipoxygenase is useful for inhibiting fungal mycotoxins when transformed into a plant or seed containing a chemically inducible but not wound or pathogen inducible gene, which involves applying a chemical cregulator to a plant or seed containing a chemically inducible containing a chemically regulatable containing a chemically regulatable containing the contained the effectiveness of conventional methods such as herbicide or pesticide treatment or allow the present or properties.

Now recons with the methods due to their modified preatment or allow the warms with improved plants for a plant or a plant or a plant or a plant increase the effectiveness of conventional methods such as herbicide or pesticide treatment or allow or warms with the methods due to their modified genetic properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New crops with improved stress tolerance can be obtained that, due to their optimised genetic equipment yield harvested product of better quality than products that were not able to tolerate comparable adverse developmental conditions. The present sequence is an anchored oligo-dt reverse RP-PCR primer (reverse transcriptase PCR) used to isolate the cDNA encoding rice lipoxygenase.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, ar integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17651 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17650 and AAA17653 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18985 to AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19155 to AAA19222 represent their corresponding target sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiathritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma;
also be formed in the motif of a hairpin, hepatitis delta virus, grou I intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of therapies for tumours. The ribozymes may also be used to study genetic drift and mutations within cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           myopic degeneration; psoriasis; verruca vulgaris; angiofibroma;

The full length mNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may

New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer

Claim 77; Page 83; 148pp; English.

The present invention describes nucleic acids (A) that interact stably

63

with a target sequence and contain at least one phosphoro(di)thioate link, having endomuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or receptor gene, are used to treat cancer (particularly of breast or receptor gene or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with cargets, and as research reagents (for RNA, in the same way that targets, and as research reagents (for RNA, in the same way that cestriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA2301 of AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA26107 to AAA2512 represent centrogen receptor harripin ribozyme sequences, AAA25019 to AAA2611 represent their corresponding target sequences. AAA25219 to AAA2611 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Claim 3; Page 38; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, ginzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug charaples such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rejection, gene therapy applications, inchine cobesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft cefection, gene therapy applications, inchammatory lowel disease or infection. This sequence represents the substrate of a novel infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule.

```
The invention relates to the inhibition of cell adhesion mediated by the MN oncoprotein (also known as the MN/CA IX isoenzyme or the MN/G250 protein). The MN protein is a tumnour-associated adhesion molecule which comprises a proteoglycan-like (PG) domain (AAB03017) which contains the protein's binding site, and a carbonic anhydrase (CA) domain (AAB03018). Abnormal expression of the MN protein is associated with tumorigenicity. The invention encompasses molecules (e.g., proteins and peptides) which which specifically bind to a site on the MN protein, thereby preventing adhesion of vertebrate cells to the protein in a cell adhesion assay. It also encompasses MN proteins on MN protein fragments which can be added to the extracellular environment to prevent the adhesion of vertebrate cells of the MN protein and to a method of identifying a site of the binding site of the MN protein and so call adhesion assay. It the binding site of the MN protein and so a method of identifying a site on an MN protein to which cells adhere, comprising testing a series of overlapping peptides from the protein in a cell adhesion assay. The invention also encompasses a vector comprising the variable domains of a MN-specific antibody, where the domains are separated by a flexible inker peptide (AAB03035) and the vector inhibits the growth of a vertebrate preneoplastic or neoplastic cell that abnormally expresses MN proteins and peptides are useful for treating patient of which inhibits the growth of a vertebrate or the MN gene promoter (AAA5473). MN proteins and peptides are useful for treating patients with or preneoplastic or neoplastic disease (e.g., cancers) associated with or a fragment of the human MN promoter (AAA52473) specified in the agreement of the human MN promoter (AAA52473) specified in the inventions.
                                                                                                                                                                                                                                                                                                                                                                                                                           A molecule which specifically binds to a site on MN protein (oncoprotein) and prevents adhesion of vertebrate cells to the protein, useful for treating preneoplastic or neoplastic diseases such as cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. Gene, in the presence of a divalent cation, especially MG/2+. The enzymatic and the presence of a divalent cation, especially MG/2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stromach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paciltaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, antisense nucleic acid molecules are also useful for treating inflammatory disease such as cohesity, autoimmune disease, lupus, multiple solerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury celectrion, gene therapy applications, ischaemia/reperfusion injury celectrion, gene therapy applications, ischaemia/reperfusion injury cepting cairway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an enzymatic nucleic acid molecule (I) which down
                                                                                                                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MN protein; tumour associated cell adhesion molecule; oncoprotein; proteoglycan domain; PG domain; carbonic anhydrase; CA domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligomacleotides (AB160512-AB131809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of between them then, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them -

```
The invention relates to a method of determining the presence or absence of a CYP2D6 target sequence in a DNA sample containing CYP2D6 nucleic acid. Determining the presence or absence of a CYP2D6 target sequence in a sample of DNA containing CYP2D6 nucleic acid comprises contacting the nucleic acid with a probe under stringent binding conditions, and determining the presence or absence of the target sequence bound with the probe with a scattered light detectable particle, by observing light sequence. The method is useful for determining the presence or sequence. The method is useful for determining the presence or absence of particular single nucleotide polymorphisms or alleles in genomic nucleic acid, especially in a pharmacogenetically relevant gene or genes in a DNA sample, and to detect and measure one or more target sequences in a sample, and to detect and measure one or more target mutations to identify the phenotypic classification of an individual.

ARX30162-ARX3010 represent CYP2D6 target sequence-specific primers
                                                                                                                                                                                                                                                                                                                   Determining the presence of a CYP2D6 target sequence in a DNA sample containing CYP2D6 mulciled acid, for detecting mutations or polyworphisms, comprises detecting the scattered light from a particle bound to the target sequence
                                                                                                                                                                                                                                     Yguerabide J;

                                                                                                                                                                          The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. The invention relates to an isolated isomaltulose synthase polypeptide, and full-length sucrose isomerase polypeptide from Erwinia rhapontici and full-length sucrose isomerase polypeptide from bacterial isolate 680. The invention or its fragment, variant or derivative is useful for producing isomaltulose from sucrose, where the polypeptide or host cell is contacted with a sucrose or a sucrose-containing substrate. Antigenbinding molecule is useful for detecting a sucrose isomerase in a sample. A differentiated plant is useful for producing isomaltulose, where the plant is caltivated and the isomaltulose from the cultivated plant is harvested. The present sequence is Erwinia rhapontici sucrose isomerase DNA amplifying PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isomaltulose synthase polypeptide isolated from Erwinia rhapontici and a bacterial isolate 68J, useful for producing isomaltulose from sucrose on contact with sucrose or sucrose-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Erwinia rhapontici sucrose isomerase DNA amplifying reverse PCR primer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

medicament for treating a syndrome associated with a human disease,

preferably a NOVX-associated disorder. The sequences are useful for

treating, preventing or diagnosting diseases such as metabolic disorders,

diabetes, obesity, infectious diseases with as metabolic disorders,

cle.g. hypertension, atherosclerosis), neurodegenerative disorders (e.g. hypertension, atherosclerosis), neurodegenerative disorders,

cle.g. hypertension, atherosclerosis), neurodegenerative disorders,

stham and various dyslipidemias. The nucleic acids and polypeptides may

asthma and various dyslipidemias. The nucleic acids and polypeptides may

also be used as targets for the identification of small molecules that

modulate or inhibit e.g. neurogenesis, cell differentiation, cell

proliferation haematopoiesis, wound healing and angiogenesis, and in the

generation of antibodies that bind immunospecifically to NOVX substances

for use in therapeutic or diagnostic methods. The nucleic acids are

further used as hybridisation probes, and in chromosome mapping, tissue

typing, preventive medicine and pharmacogenomics. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                metabolic, antimicrobial, neuroprotective, antiparkinsonian, cardiant, antilipaemic, cytostatic; immunomodulatory; gene therapy; dyslipidaemia, cardiomyopathy; metabolic disorder, diabetes; atherosclaerosis; obesity; anorexia, neurodegenerative disorder, Alzheimer's disease; cancer; Parkinson's disease; haematopoietic disorder; metabolic disturbance; metabolic syndrome X; wasting disease; probe; ss.

                                                                                                                                                                                                                                                                                                                                                               This invention describes novel polypeptides, termed NOVX which have antidiabetic, antiarteriosclerotic, anorectic, metabolic, antimicrobial, neuroprotective, antiparkinsonian, antilipeemic, cytostatic, nootropic, cardiant and immunomodulatory activity. The polypeptide and any antibodies generated from it are useful in the manufacture of a medicament for treating a syndrome associated with a human disease selected from a pathology associated with the NOVX polypeptide. Fragments and portions of the polymucleotides encoding NOVX polypeptides are useful to map the location of NOVX genes on a chromosome, to identify to map the location of NOVX genes on a chromosome, to identify individuals from minute biological samples, as DNA markers for restriction fragment length polymorphism (RFLP), and are useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prepare polymerase chain reaction primers. The products of the invention can be used in gene therapy and for treating cardiomyopathy, metabolic disorders, diabetes, atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, and various syndrome X and wasting disorders associated with obssity, metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. ABX56307-ABX56465 represent PCR primers and probes used in the amplification and detection of the NOVX polynucleotides
                                                                                                                                                                                                                                                                   New isolated NOVX polypeptide useful for treating cardiomyopathy, atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease and

Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3 -directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41334 amplify clone pm0559 which comprises the GS HUMGS001489 (T20489), located on chromosome 11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying gene signatures in 3'-directed human cDNA library - e.g. for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analysis; gene expression; reverse transcription; primer; cDNA;

This sequence is based on a Tsex sequence obtained from a cDNA library prepared from a turkey embryonic poly(A)+ mRNA. This can be used as a primer. The Tsex sequence or its complementary sequence or a sequence of at least eighteen contiguous nucleotides of one of these sequences can be used for the identification of sex in avian species. These sequences can be used for the production of a variety of nucleic acid hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                         sex determination; Tsex; probe; Z chromosome; W chromosome;

probes and amplification primers. This primer can be used in combination with an Obex or an Esex sequence. The primers and probes can hybridise to both Z and W sex chromosomes allowing for differentiation between the two chromosomes based on length polymorphisms. Alternatively, they may hybridise to one of the chromosomes, permitting gender identification on the basis of sex-specific hybridisation intensity. The combinations of primers from different sequences allows amplification of fragments from a specific chromosome. This primer sequence is exemplary of an intron sequence that is specific to the W chromosome of many avian species. The primers/probes are used to determine the sex of birds (e.g. poultry or emus) before development of obvious external sexual differences.

                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESC files AAQTSST-07578) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression

Alpha epithelial sodium channel; alphaENACa; alphaENACb; binding as: amiloride-sensitive salt channel alpha subunit; membrane-transport; salt substitute; salty taste blocker; PCR primer; amplify; ss. Alternatively spliced epithelial sodium channel alpha subunit proteins - useful in screening assays for salty taste enhancers or Primer alphaEN-S2 for alphaENAC coding sequence. Snyder SH; 95US-0376362. 94US-0202654. 95US-0376362 (UYJO) UNIV JOHNS HOPKINS. (first entry) Li X, WPI; 1998-031814/03 Rattus rattus. Blackshaw S, 24-MAR-1998 23-JAN-1995; 28-FEB-1994; 23-JAN-1995; US5693756-A. 02-DEC-1997 Synthetic blockers

This sequence represents a primer for the coding sequence for the alpha epithelial sodium channel a (alphaENACa). AlphaENACa (see AAW34529) and alphaENACA (see AAW34529) and two sodium channels are alternatively spliced forms of the amplanetrans amiloride-sensitive salt channel alpha subunit and can be used in membrane-transport or binding assays to identify subscrances that enhance or block perception of a nadity taste. Enhancers could be used as salt substitutes and blockers could be used to mask salty tastes.

AAZ37411, AAZ37422, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound with mdm2, particularly a hyperproliferative condition associated particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compounds used to treat eg. hyperproliferative conditions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention descibes a novel method for the analysis of a DNA fragment which comprises: (i) addition of a known common oligonucleotide sequence to at least one terminal of each DNA fragment, (ii) amplification of the resultant DNA fragment as a primer using a first common primer containing a complementary nucleotide sequence to the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mentioned known common oligoniclectide sequence, a second common primer containing a complementary nucleotide sequence to the prepared known common oligoniclectide sequence to the prepared known common oligoniclectide sequence at a terminal, and a specific primer capable of hybridisation with a DNA fragment containing whole or part of the gene having known sequence, to give amplified DNA, (iii) analysis of the amplified and to find the information of the DNA of the sequence, to give short fragments of the common first and second primers and to give short fragment of the common first and second primers and to give short fragment of the common first and second primers and to give short fragment of the differentiation of informations of known and unknown genes readily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                provides information of unknown gene and simultaneous monitoring of signals derived from minor genes. Furthermore, labelling of DNAs according to functions of known genes can be performed. AAZ09189-Z09201 represent oligomucleotide primers used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

                                                                                                                                                                                                                              Primers AAX26903-04 were used for STS-PCR mapping of RIGUI nucleic acids. RIGUI is a gene corresponding to the Drosophila circadian rhythm period gene. The specification describes both mouse and human genes. The RIGUI polypeptides act as regulators of circadian human genes. The identification of RIGUI as a putative circadian clock gene provides a useful tool to explore the molecular mechanism of the mammalian circadian machinery. Using interaction screening gene provides, it should be possible to find interacting proteins, perhaps in the form of a Drosophila Timeless ortholog. Purthermore, promoter analyses of the RIGUI gene should uncover how light cues of and possibly other environmental stimuli, regulate the expression of this gene. Targeted disruption of the m-rigui gene using stem cell technology, may provide a valuable model system to study the various which which me

analysis of a plasmid containing the murine villin gene regulatory region. It has been shown that this region directs the expression of the villin gene in the intestine and uro-genital tracts, and thus could be used in a fusion gene to direct expression of exogenous genes in these areas. This could be used, for example, to create a mouse model for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a PCR primer used to amplify the murine villin gene. The villin gene is expressed in the epithelial cells of the intestine and uro-genital tracts. Its promoter sequence can be used in the targeted expression of exogenous genes in these places, which may,
                                                                                                                                                                                                                Novel nucleotide sequence derived from mouse villin gene for targeted expression of transgenes in immature and differentiated epithelial cells of intestine or urogenital tracts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleotide sequence derived from mouse villin gene for targeted expression of transgenes in immature and differentiated epithelial cells of intestine or urogenital tracts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a PCR primer which was used in the RT-PCR

decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and isobaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense compounds, 8-30 nucleobases

hyperproliferative disorder as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restensis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a compound reduces hyperproliferation of human cells. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting processes and useful in both clinical research and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense oligonucleotides
in length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start state of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonuclectides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human

The invention comprises nucleic acids that show increased expression in human neuroblastomas with poor prognosis over those with a good prognosis. The nucleic acids of the invention are useful as a tool for distinguishing neuroblastomas with a favourable prognosis (spontaneous regression) from neuroblastomas with a poor prognosis (high malignancy). The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used in

The present invention relates to an antisense compound 8-30 mucleobases in length targeted to nucleobases 1-308 of the codon resisted region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues

The present invention describes a nucleic acid molecule (NA) (I) encoding a bovine acyl CoA-diacyJglycerol transferase (DGAT) contributing to or indicative for low fat content of milk and to low meat marbling (intramuscular fat content). Human DGAT is located to chromosome 8, and bovine DGAT is located to chromosome 14. (I) is useful for testing a mammal for its predisposition for fat content of milk and/or its predisposition for meat marbling. The method comprises analysing the predisposition for meat marbling. The method comprises analysing the predisposition for meat marbling. The method comprises analysing the predisposition for meat marbling. The method comprises analysing the prolymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polypeptide which is encoded by the gene. The nucleic acid molecule has at the position 10433 and 10434 of the DGAT gene a quantine and a cytosine residue, at position 343 a cytosine or thymine, which correlate with a predisposition for low fat content of thymine, which correlate with a predisposition for high content of milk and how meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine cresidues which correlate with a predisposition for high content of milk and high meat marbling. The nucleic acid molecule has at the position of residues which correlate with a predisposition for high content of milk and high meat marbling. The nucleic acid molecule has at located in a regonstile position of the expression of the product of the gene encoding DGAT. ABZ77045 and ABP966035 to product of the gene encoding DGAT. The present interface described as interface and interface and understributing to or indicative for low fat content of milk and to low meat marbling to or indicative for low fat content of milk and to low meat marbling to bovine DGAT is located to chromosome 8, and bovine DGAT is located to chromosome 8, and content of milk and or its useful for testing a mammal for its predisposition for fat content of milk and/or its content of milk and or its mammal for its predisposition for meat marbling. The method comprises analysing the gene encoding DGAT for nucleotide polymorphisms (e.g. single nucleotide polymorphisms (sNPB)) which are connected with the predisposition. The nucleotide polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polymorphism at position 10433 and 10434 of the DGAT gene a quanine and a cytosine or thymine and il039 a cytosine or thymine, which correlate with a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position of corresponding to position 10433 and 10434 of the DGAT gene two adenine corresponding to position 10433 and 10434 of the DGAT gene two adenine cregion which is responsible for the requiation for high content of milk and the gene encoding DGAT. ABZ70924 to ABZ77045 and ABP96035 to substitution and in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a nucleic acid molecule (NA) (I) encoding

The present sequence is a sequencing primer which is used for sequencing the human insulinoma-associated antigen, IA-1 cDNA clone. The IA-1 function as a regulatory factor in islet cell transformation. The IA-1 is used as a tumour marker for diagnosis and identification of insulinoma and neuroendocrine tumours. It is also used for dentifying cancers. Correct identification of insulinomas and cancers is possible. The IA-1 fragments may be used to immunise animals for the generation of polyclonal and monoclonal antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel insulinoma-associated neuroendocrine tumor-associated cDNA, useful for diagnosing and identifying insulinoma, neuroendocrine tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR; primer, ss; liver regeneration; gene panel; expression profile; drug screening; drug development; hepatitis; liver transplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of screening a candidate compound for inhibition of a target enzyme. The method involves combining candidate compound, an enzyme donor-conjugate and an enzyme acceptor compribing inactive portions of an indicator enzyme, target enzyme and a substrate for indicator enzyme under binding conditions, where substrate reacts to form a product, and substrate or product provides a detecrable carginal, and substrate or product provides a detecrable carginal, and determining the signal. The method is useful for screening a candidate compound for effective inhibition of a target enzyme, where the argret enzyme includes plural target enzymes selected from lyases, hydrolases, oxidoreductases, transferases, ligases, isomerases and kinases and the target enzyme is derived from an organism selected from viruses, bacteria, fungi, protozoans, and multicellular human parasates. I this useful for identifying inhibitors that function as antibiotics. Inhibitors identified are useful as lead compounds for effective drugs with increased potenty and fewer side effects, for treating human elements is sequence is and improving human health. The present sequence is a DNA fragment used to construct beca-galactosidase enzyme acceptors. This sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                         q
                                                                                                                                                                                                                                                                     ò
                                                   Gene panel participating in liver regeneration, applicable in providing expression data, diagnosis and development of drugs for promoting liver regeneration e.g. after transplantation or removal of liver during
                                                                                                                                                              drugs
                                                                                                                           The invention comprises a gene panel constructed from the expression profile of known genes which show a change in expression level between normal liver cells and liver cells under regeneration. The gene panel useful for providing expression data and screening/development of drugs for liver regeneration (e.g. when treating hepatitis, after transplantation or removal of the liver during cancer or hepatitis therapy). The present DNA sequence represents a PCR primer used in the

Diagnosis of hereditary retinal degenerative diseases e.g. retinitis pigmentosa, - caused by a human photoreceptor protein mutation, by detection of the mutation by PCR amplification or hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This antisense primer is derived from exon-13 of the human retinal rod cGMP-phosphodiesterase beta-subunit (PDB-beta) gene, and may be used for PCK amplification and sequencing of normal and mutant forms of the PDB-beta gene. The primer may be used along with sense primer AAT17133 to detect a variant with a C-to-T transition at position 19876 in exon-13, resulting in a missense mutation (HisS5TYTY) (e.g. in patient ARG7) linked with autosomal recessive retinitis pigmentosa. Mutations in the rhodopsin and retinal degradation slow protein genes are also implicated in retinitis
analysis (using the "Primer" program available from E. Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for the sequencing complex genomes, designated "sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones.

See AAQ22001-Q82706 for STS primers. (Also see AAQ91325-58).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for DNA analysis based on a complementary extension reaction using a DNA polymerase, comprises a combination of fragment walking and DNA sequencing. DNA fragments are formed by digestion of DNA with a restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overall base sequence of a lengthy DNA can be determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially existing methods. AAT73291-92 are primers primers than required in existing methods. AAT73291-92 are primers used in determination of the purch of the primer extension was carried out using 16 primers
modulate the expression of nucleic acid under control of the promoter. Antibodies are used to determine the presence, amount or location in a cell of a BRCA2 polypeptide or its mutant forms. The polypeptides are used to screen for binding partners, these are useful to screen for substances which minic the activity of BRCA2 polypeptide, which can be used as cancer therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polymerase chain reaction; sequencing; walking; extension reaction; low redundancy; universal primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a PCR primer for single stranded conformation polymorphism testing of the BRCA2 cancer susceptibility gene. The nucleic acid molecule can be used to construct probes for screening cDNA or genomic libraries, sequencing positive clones for card molecules and proteins are useful in a method of medical reatment, preferably gene therapy, sepecially for treating cancer, where the cancer is female or male breast cancer, ovarian, prostate or colorectal cancer, ocular melanoma or leukaemia. In particular antisense oligonucleotides capable of hybridising to the BRCA2 nucleic acid, pre-mRNA or mature mRNA are used so that the expression of the BRCA2 nucleic acid is reduced or prevented. The nucleic acid molecules are also useful in a method for diagnosing susceptibility or predisposition to cancer in a patient. The mucleic acid molecules are used to design probes or primers for PCR to determine or detect the BRCA2 promoter region is useful for screening for substances which

Primers AAV57164-V57197 are used to detect mutations in a partial human
Notch-3 gene (AAV57163). Primers AAV57182-V57183 amplify a fragment
from exon N12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Notch3 is a transmembrane receptor protein involved in lateral inhibition and regulating developmental cascades of neurogenic genes. Mutated Notch3 proteins are thought to be involved in neurological disorders, especially of the cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) type. Blocking expression of a mutated Notch3 gene or by substitution therapy with non-mutated Notch3 gene or protein can be used to treat CADASIL or

Primers AAV5701-V57102 amplify a 207 bp fragment from the EGF18-19 domain sequences found in exon 14.

Notch3 is a transmembrane receptor protein involved in lateral inhibition and regulating developmental cascades of neurogenic genes. Mutated Notch3 proteins are thought to be involved in neurological disorders, especially of the cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASII) type. Blocking expression of a mutated Notch3 gene or by substitution therapy with non-mutated Notch3 gene or protein can be used to treat CADASII or

This sequence represents human chemokine receptor CXCR3b-specific reverse transcriptase-PCR (RT-PCR) primer SCM54, used with primer SCM56 (AAZ32721) to amplify human obemokine receptor CXCR3b CDN4 for expression studies. The template CDN4 was prepared via reverse transcription from studies. The template CDN4 was prepared via reverse transcription from studies. The template CDN4 was prepared via reverse transcription from studies. The template CDN4 was prepared via reverse transcription from studies. The template CDN4 was prepared via reverse transcription from cof both forms was detected in human Th1 and Th2 cells and also faintly in splean. Chemokines are a family of small cytokines which bring about the recentiment of leukcytes during inflammation. The CXC chemokines mostly attract neutrophils, while the CC chemokines are less selective. All chemokine receptors are seven transmembrane G-protein coupled receptors are receptors for a number of chemokines. CXCR3a ceptors and most are receptors for a number of chemokines. CXCR3a is expressed in activated, but not in resting T-lymphocytes, and may therefore play an important role in the selective recruitment of CXCR3b may have an altered pattern of tissue distribution and constrain and in the inflammatory process. Cells expressing the active CXCR3b may have an altered pattern of tissue distribution and cantend and attend pattern of tissue distribution and cantendomists, of a chemokine receptor. In addition, the receptor for facilitates identification of chemokines responsible for mediating cof inflammatory responses is of therapeutic benefit in many conditions cut as rheumatoid arthritis, psoriasis, multiple sclerosis, transplantation, delaped type hypersensitivity reactions;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers AAV38812-13 were used to amplify the glutenin gene of Triticum durum L. The gene codes for a low-molecular-weight glutenin protein and can be used to produce transgenic durum wheat plants with "better quality characteristics" [no details given]. (Updated on 25-WAR-2003 to correct PI field.)

                                                                                                                                                         PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines
                                                                                                                                                                                                        encode portpetities there are soft the mice can be used as vaccum against Chiamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase (JNK) proteins. The

             JUNE, JUNE OF JUNE process, and which modulate expression of these proteins. The oligonucleotides are useful for modulating JUNE protein expression and cell cycle progression in cultured cells or animal or animal cells. The oligonucleotides are also useful for modulating the phosphorylation of a protein that has been phosphorylated by a JUNE protein, and the expression of a cellular protein that promotes one or more metastatic events. The oligonucleotides also form pharmaceutical compositions for treating animals with a hyperproliferative disease, and for inhibiting specifically hybridise to nucleic acids encoding rat stress activated protein kinase (SAP) or p54, a homologue of human JUNE protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side
                                                                                                                                                                                                                                                                                                                         Gaps

Novel biallelic markers used to construct a high density disequilibrium map of the human genome

Claim 9; Page 2707; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

```
The present invention describes an antisense compound (I), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (I) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, prostate, brain, head and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and processes and conditions and for diagnostic methods in detecting and processes and conditions and for diagnosing the conditions associated with expression of STAT3 in various cell functions, physiological processes and conditions and for diagnosing the conditions associated with expression of STAT3. (I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC93231 encodes mouse

or tissues New antisense compound for inhibiting the expression of signal transducer and activator of transcription.3 (STAT3) in cells or ti and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer -

Example 2; Page 47; 104pp; English.

The present invention describes an antisense compound (I), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule cancellong STAT3 (signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (I) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a numan having a disease or condition characterised by a reduction in conspotencis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, constate, brain, head and/or neck, leukaemia, mysloma, melanoma or prostate, brain, head and/or neck, leukaemia, mysloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions and for diagnosing the conditions associated with expression of STAT3. (I) can be used alone or with other drugs as an immostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 co AAC93230 and AAC93230 represents STAT3 phosphorothicate antisense oligonucleotides, and AAC93300 represents a mismatch control cligonucleotide which are used in example from the present invention.

ô The present invention relates to antisense oligonucleotides (AACC2844-C63000, AAA96033-A96099 and AAA07933) that hybridise specifically to a nucleotide encoding a Una N-terminal Kinase (JNK2) protein, resulting in decrease of UNK2 expression and leading to induction of apoptosis. The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or Parkinson's disease, amylotrophic lateral sclerosis, retinitis, pigmentosa, epilepsy, mycardial infarction, stroke, obstructive jaundice, polyvoystic kidney and diabetes. The present sequence may have a phosphorothioate backbone. Gaps ö Score 14.2; DB 1; Length 20; Pred. The present invention describes a method for the identification of animal meat in which at least one animal meat is selected from bovine and sheep species. The method comprises carrying out PCR by using the DNA extracted from the animal meat and at least one species-specific primer designed from the cytochrome b base sequence to amplify the DNA and then analysing the amplified product. The method can be used for the identification of animal meat in high precision. The present sequence represents a specifically claimed bovine cytochrome b PCR primer for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   Identification of animal meat with DNA comprising carrying out PCR by using the DNA extracted from the animal meat and at least one species-specific primer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a genetically modified plant (I) comprising at least one exogenous nucleic acid sequence encoding a BASI polypeptide, homologue or functional fragment, in its genome or at least one regulatory sequence that modified expression of endogenous basil gene, homologue or functional fragment, and which is characterised as having modulated brassinolide activity or synthesis. The basil gene encodes a cytochrome P450 (CMP72BI), which has a role in brassinosteroid signalling or synthesis. Overexpression of the basil gene suses a dark green, dwarf phenotype which mimics plants that have low levels of the plant hormone, brassinolide. Overexpression of the basil gene also increases resistance to insects in plants. The present sequence represents a PCR primer used in the analysis of putative suppressors, having shorter hypocotyls than phyB-4, for the phyB-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transgenic plants having modulated brassinolide synthesis resulting in insect resistance, dwarfism and darker-green foliage compared with wild-type plants, have nucleic acid encoding BASI polypeptide in its

The present invention describes a method for the identification of animal fiber in which at least one animal fiber is selected from bovine, camel, goat and sheep species. The method comprises carrying out PCR by using the DNA extracted from the animal fiber and at least one species specific primer designed from the cytochrome b base sequence to amplify the DNA and then analysing the amplified product. The method is used for the identification of animal fiber in high precision. The present sequence represents a specifically claimed bovine cytochrome b PCR primer for use in the method of the invention.
extracted from animal fiber primer -

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains Example 15; Page 49; 139pp; Japanese. anti-Fas antibody

е. 9. preventing inflammatory or autoimmune disease, induces apoptosis selectively cells with abnormal Fas-Fas ligand systems New humanized anti-Fas antibody, useful for treating or

Example reference 15; Page 136; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, inmunosmodulatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiatreriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive

inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, solorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, soleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, alleray, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B). C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents primer used in the construction of a humanised anti-Fas antibody HFBTA designed heavy chain which is used in the method described in the Gaps therapy, screening, polymorphism; variant; detection; mutant; blood; mutation; insulin; glucose metabolism; fatty acid metabolism; catecholamine; malaria; infection; parasite; antiparasitic; Nucleic acids encoding mutant CD36 proteins useful for preventing, diagnosing and treating parasitic infections, especially malaria -; SHR; spontaneous hypertensive rat; diagnosis; Score 14.2; DB 1; Length 20; Pred. single-stranded oligonuclectides (ON) having a consensus MS repeat sequence (MSRS) or its complement; (ii) washing under specified stringency conditions, (iii) eluting nucleic acid bound to ON; and (iv) sequencing the eluted nucleic acids to identify those containing an MSRS. Microsatellites (MS) isolated by the method, specifically from Melaleuca alternifola (the tea tree, a source of a broad-spectrum germicidal oil, useful in parameeuticals and commetics), are useful as genotyping markers, particularly for breeding plants that produce the coll in higher yield or of better quality. Primers based on MS are useful for both inter- and intra-species genotyping. The selected washing conditions improve efficiency of recovery of microsatellites (MS) and reduce the number of washing stages required. Particularly compared with 50-70% when the conventional washing procedure is compared with 50-70% when the conventional washing procedure is followed. AAA35313 to AAA35557, and AAA35552 to AAA35575 represent nucleotide sequences from the present invention which contain microsatellite sequences. PAAA3558 to AAA35561 represent oligonucleotide PCR primers used for identifying Myrtaceae microsatellite sequences.

internal controls and analogue blocks Example 4; Column 21; 29pp; English. Methods using exogenous, internal during nucleic acid amplification

The invention relates to methods of rendering reporter-quencher probe assays more meaningful by the addition of internal control agents. Primers for a target and an internal control sequence are labelled with a detectable marker which allows concurrent detection and measurement of target and control nucleic acid amplification. The reaction may also contain a non-extendable oligonucleotide (i.e. a blocking sequence) complementary to the internal control sequence, which functions as a negative control. The method can be used for quantitating nucleic acid

```
and concurrently with,
amplification of control DNA in the presence of, and concurrently with nucleic acid amplification of known or unknown target DNA. Suggested uses include tracking of target sample extraction, isolation and purification, for amplification of low copy number genes, for allelic discrimination of polymorphic samples or pathogen detection. Primers AAZ40588-Z40559 are used to detect NPTII RNA in transgenic B.Coli by the method of the invention. Primers AAZ40588-Z40589 were used for amplifying the NPTII target sequence.

New polypeptide for screening for compounds which treat inflammatory diseases such as bronchitis, dermatitis, psoriasis, ulcerative colitis, rheumatoid arthritis, and edema comprises the leukotriene B4 receptor -WPI; 2001-611487/70.

Example 10; Page 47; 55pp; Japanese.

B4 compositions containing materials which modify the receptor activity, other than 4-octyloxybenzene carboximidoamide are used for treating and preventing inflammatory disease. The materials detected by screening the receptor (UULE) are useful for treating diseases such as bronchitis, dermatitis, psoriasis, ulcerative colitis, rheumatoid arthritis, and edema. Sequences AAI66614-19 represent PCR primers for amplifying a rat leukotriene B4 receptor JULF2 DNA. The invention provides a leukotriene receptor, which binds leukotriene and polynucleotides encoding the leukotriene B4 receptor. The receptor can be expressed by standard recombinant methodology. The sequence represents a splice site within a DNA molecule encoding muman PD-APT-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19pl3.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary artery disease, Tangier's disease, fanty liver disease, intoprotein deficiency, atherosclerosis, diabetes, fatty liver disease, insulin resistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences are also used in drug screening assays.

```
The sequence represents a splice site within a DNA molecule encoding human PD-AIP-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19513.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary artery disease, rangiaer's disease, familial high-density lipoprotein deficiency, atherosclerosis, diabetes, fatty liver disease, insulin remistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences

```

The present invention relates to ligand dependent transcriptional factors including oestrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (RN), mineralocorticoid receptor protein (RN), mineralocorticoid receptor protein (RN), peroxisome proliferator-activated receptor protein (PRAR), pregnane X receptor protein (PRAR), thyroid hormone receptor protein (FR) and vitamin D receptor protein (PRAR), the mucleic acids encoding them and cells comprising them and a specified reporter gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor cativity. The cells, mutant ERalpha and the polynucleotide encoding it may be used in assays for qualitatively analysing an activity for transactivation of a reporter gene by a test ERalpha, for screening mutant ligand dependent transcriptional factors, for evaluating an activity for transactivation of a reporter gene by a test ERalpha and/or for screening a certivity for transactivation of a reporter gene by a test ERalpha and/or for screening a promound useful for treating a disorder of a mutant especially breast cancer.

The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a
                                                                                                                                                                                                                                                                                                                             Antisense compound capable of modulating the expression of phosphoenol pyruvate carboxykinase-cytosolic, useful for preventing or delaying infection, inflammation or tumor formation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Secreted protein; human; PRO protein; neoplastic cell growth; tumour; proliferation; leukaemia; lymphoid malignancy; inflammatory disorder; anglogenic disorder; immunologic disorder; PRO6496; PCR primer; ss.

This sequence represents a PCR primer used to isolate DNA encoding human PROSBO0 protein of the invention. The PRO proteins are secreted proteins. Antagonists or antibodies of PRO polypeptides are useful for diagnosing and treating tumours are associated with gene amplification, neoplastic cell growth and proliferation in mammals, and those conditions characterised by overexpression and/or activation of the amplified genes. Such conditions include benign or malignant tumours (e.g. renal, liver, kidney, bladder, breast, gastric, ovarian, colorectal, prostate, conditions include benign or malignant tumours (e.g. renal, liver, kidney, bladder, breast, gastric, ovarian, colorectal, prostate, gancareatic, lung, vulval, thyroid, hepatic carcinomas, sarcomas, glioblastomas and various head and neck tumours); leukaemias and lymphoid malignancies; neuronal, glial, astrocytal, hypothalamic, and other glandhlar, macrophageal, epithelial, stromal and blastocellic disorders; and inflammatory, angiogenic and immunologic disorders. These may further be used to qualitatively or quantitatively detect the expression of prognostics. The PRO polypeptide or its antagonist may be used for the preparation of a medicament in the treatment of a condition, which is responsive to the PRO polypeptide, its antagonist or anti-PRO antibody.

The invention relates to a recombinant gene that comprises, a gene encoding human P450 or its variant, the human EFIalpha promoter, chick beta globin insulator sequence or a part of it, and the SV40 polyA-attached signal. The activity of the gene of the invention may be described as, antidiabetic, neuroprotective, cerebroprotective, notropic, cytostatic, cardiant, nephrotropic, osteopathic, antiallergic, antiarteriosclerotic and anti-microbial. The intention of this invention is to provide a transgenic animal. The animal is useful in testing fectoxicity and/or teratogenicity, and is applicable to drug development for diseases including diabetes, infections and dementia. The current sequence represents a primer designated CYP2E1 sense primer, which is used in an example from the invention in the amplification of cytochrome P from total RNA from human liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mouse; immune response; IL-13; NK-T cell; cancer; metastasis; PCR; interleukin-13; neurokinin-T; antitumour; virucide; cytostatic; anti-HIV; hepatotropic; immunostimulant; antiinflammatory; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the inhibition of tumour growth. It involves administration of an inhibitor of interleukin-13 (IL-13) comprising an IL-13 ligand, or a neurokinin-T (NK-T) cell inhibitor. The method can be used to inhibit tumour and virus growth and chronic infection and for enhancing an immune response in mammals (preferably humans). The present sequence is a PCR primer used to amplify the murine
development for diseases including diabetes, infections and dementia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Noben-Trauth N;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the use of homeodomain-interacting protein kinase HIPK2 to modulate cell differentiation and proliferation and to diagnose and treat associated diseases, including cancers, particularly lymphoma and carcinoma (of breast, liver, stomach, intestines, lung, ovary or cervix), and to promote wound healing. The present sequence is a PCR primer used to isolate the human HIPK2 coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of homeodomain-interacting protein kinase for modifying cell behavior, treatment or diagnosis of proliferative diseases and in drug screening -
                                                                                                                                                                                                                     Human homeodomain-interacting protein kinase HIPK2 cDNA PCR primer #1.
                                                                                                                                                                                                                                          Human; homeodomain-interacting protein kinase 2; HIPK2; cancer; enzyme

Monitoring the immune system for prevention and/or treatment of T-cell mediated diseases e.g. allergy, autoimmunity or cancer, involves mediated diseases e.g. allergy, autoimmun detecting modulation of Notch signalling

Disclosure, Fig 13; 75pp; English.

The present invention relates to a new method for monitoring the immune system that involves detecting modulation of Notch signalling. The method of the invention can be used for monitoring the immune system such as detecting or monitoring T-cell activation or inactivation, immunological tolerance or activity, monitoring the efficacy of immunotherapy and for detecting or monitoring the reactivity of a T-cell to an antigen e.g. for detecting increased or decreased reactivity of a T-cell to an antigen and detecting tolerisation of a T-cell to an antigen and detecting tolerisation of a T-cell to an antigen and prevention and/or treatment of T-cell mediated diseases such as asthma, complexity autoimmunity, graft rejection, tumour induced aberrations to the prevention and/or treatment of T-cell mediated diseases such as asthma, allergy, autoimmunity, graft rejection, tumour induced aberrations to the T-cell system, and infectious diseases caused by e.g. Cytomegalovirus, Pseudomonas, Toxoplasma, Microfilatia, Helminths, Mycobacteria, human immunodeficiency virus (HIV), plasmodium species, Echinococcus, completed for the treatment of multiple sclerosis, rheumatoid arthritis, diabetes and for corgan transplantation. The present assay completed a much more objective measures which are content present. The ability to detect an immune response could be therapy than the rather subjective symptoms-based measures which are coften used at present. The ability to detect an immune response could be activity of the immune system in the presence of different potential allergens. The assay could be used to check for successful immunisation against a given disease antigen. The present acid sequence

specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antialleragic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention.

The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, or residued in the specification and having an activity of combining

The invention relates to an isolated polypeptide, comprising a variant corm of mouse or human SACI polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SACI expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgence or repress function of SACI. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human cell spence are variations of the SACI gene. A sequence variation of the SACI locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent CDNA encoding human and mouse SACI polypeptides and PCR primers specific for the SCAI genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STAT3; human; signal transducer and activator of transcription; ss; STAT; antisense gene therapy; Fas-mediated apoptosis; inflammatory disease; autoimmune disease; rheumatoid arthritis; cancer; breast; prostate; head; neck; brain; leukaemia; myeloma; melanoma; lymphoma; apoptosis; antiinflammatory; immunosuppressive; antirheumatic; antiarthritic;

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for the activator of STAT3 in cells or tissues, inducing Fas-mediated apoptosis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune disease, particularly rheumatoid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myelomas.

Characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3 oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;

```
The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3, the antisense sequences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing rea also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune disease, particularly rheumatoid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myelomas, melanomas and lymphonas. Also treatable are human diseases or conditions characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3. The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides.
                                                                                                                                                                                                                                     Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 5 A; 7 C; 5 G; 3 T; 0 other;

Barany F,

```
for modulating the expression of interferon gamma receptor I (IFNGR1).

The compositions comprise antisense compounds, particularly antisense cliquoucleotides, targetted to nucleic acids encoding IFNGR1. The antisense compound is useful for treating a disease or condition associated with IFNGR1, such as an autoimmune disorder (e.g. diabetes, autoimmune thyroiditis, multiple sclerosis, autoimmune arthritis, autoimmune thyroiditis, multiple sclerosis, autoimmune arthritis, condition caused by aberrant apoptosis. It is also used for inhibiting the expression of IFNGR1, as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, as prophylactic agents (e.g. to prevent or delay infection, inflammation or tumour formation), and as probes or primers: It is also used in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human IFNGR1 DNA. This sequence is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides targeted to a nucleic acid molecule encoding interferon gamma receptor 1, useful for treating an autoimmune disorder, e.g. diabetes, multiple sclerosis or Crohn's disease, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense compounds, compositions and methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense; interferon gamma receptor 2; autoimmune disorder; cancer; autoimmune thyroiditis, autoimmune insulinitis; multiple sclerosis; diabetes; autoimmune arthritis; Crohn's disease; apoptosis; IFNGR2; gene therapy; prophylaxis; human; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 14.2; DB 1; Length 2
